

ABSTRACT

A ladder that is more user friendly than arts on the market today. This is accomplished by (1) moving the steps of the ladder closer together than present day ladders (2) by putting a warning bell on the second step from the bottom, (3) warning that there is another step below before stepping on solid turf (4). Individual adjustable leg length is another new feature in making modern ladders. This eliminates the time spent looking for a block to put under the short leg. This saves time and trouble. Having steps closer together makes it easier for the elderly and the handicapped to ascend and descend the ladder. There are other fine features found in this ladder.
